Flea Preparations – Dog

Frontline Spot On

Uses: The treatment and prevention of flea and tick infestations in the dog and part of the treatment strategy for flea allergic dermatitis.

Frontline spot on can be used from 8 weeks of age.

Administration: Hold the tube upright and tap the narrow part of the pipette to ensure contents are within the main body. Snap off the top of the pipette along the scored lines. Part the coat between the shoulder blades until the skin is visible. Place the tip of the pipette on the skin and squeeze gently to empty the contents onto the skin. This should preferably be done in 2 places; 1 at the base of the skull and the other 2 – 3cms back.

- It is important to apply the dose where the animal can't lick it off.
- Wash Hands after Use.
- Do not smoke/drink/eat during application.
- Ensure treated animals don't groom each other.

Monthly Treatment Required.

Frontline Spray

Dosage: Spray the entire animal applying from a distance of 10-20cms. Ruffle the coat so that the product covers all the hair and the skin to ensure an effective application. Allow the animal to dry naturally. To treat the head spray some application onto your gloved hand and rub into the hair and skin.

Stronghold Spot On

This is a similar product to frontline and is applied in the same way. It also needs to be used monthly. It prevents:

- Roundworm
- Hookworm
- Biting Lice
- Sarcoptic Mange
- Ear Mites
- Heartworm

Stronghold is available to buy in packs of 3 pipettes. It is also available for puppies weighing less than 2.5kg. It can be used from 6 weeks of age.

Prac-tic

This is another spot on application. The main advantage of this product is that the dog getting wet does not affect it. This means it is ideal for use in dogs that love water! This is also available to buy here at reception.
